

A planet is large  
and round. It usually  
travels around the  
sun or another star.

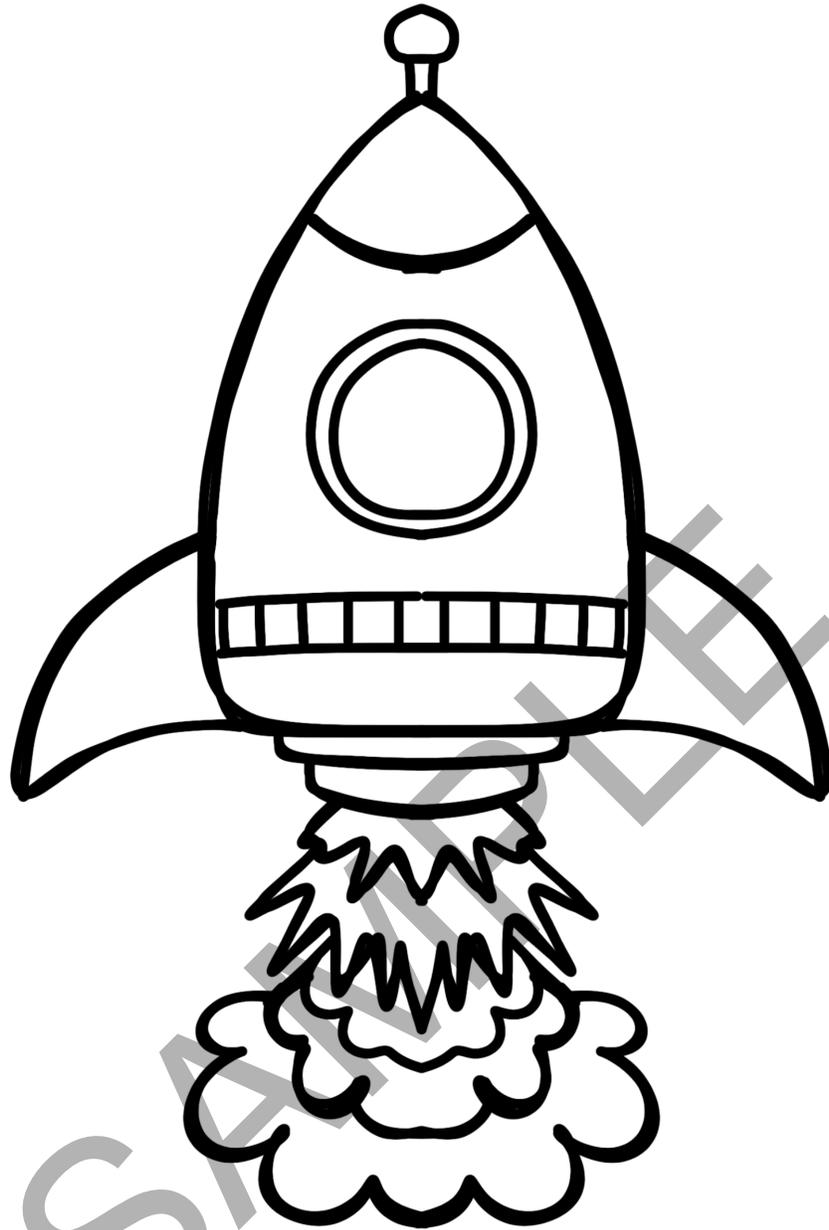

Have you ever  
wondered about  
planets other  
than Earth?

No one has been  
able to travel to  
another planet yet.

A spaceship for  
people has not been  
invented that can  
go far enough or  
fast enough.

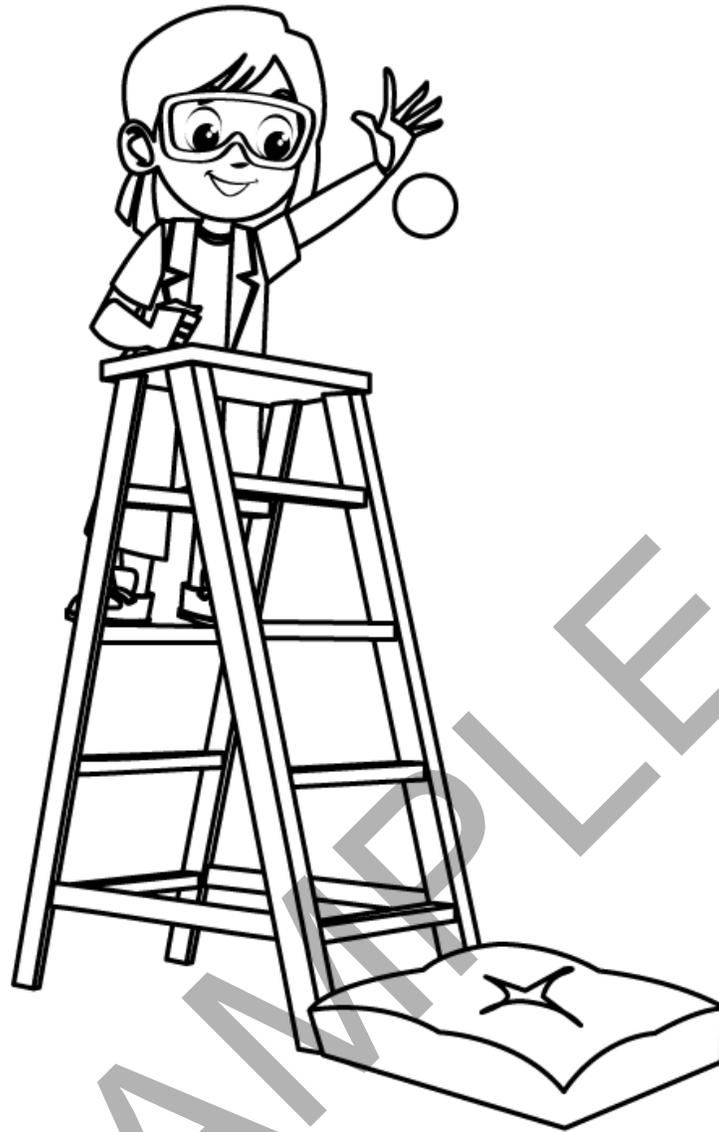

Let's imagine what it  
would be like to go  
to the planets to  
learn about them.

# GRAVITY

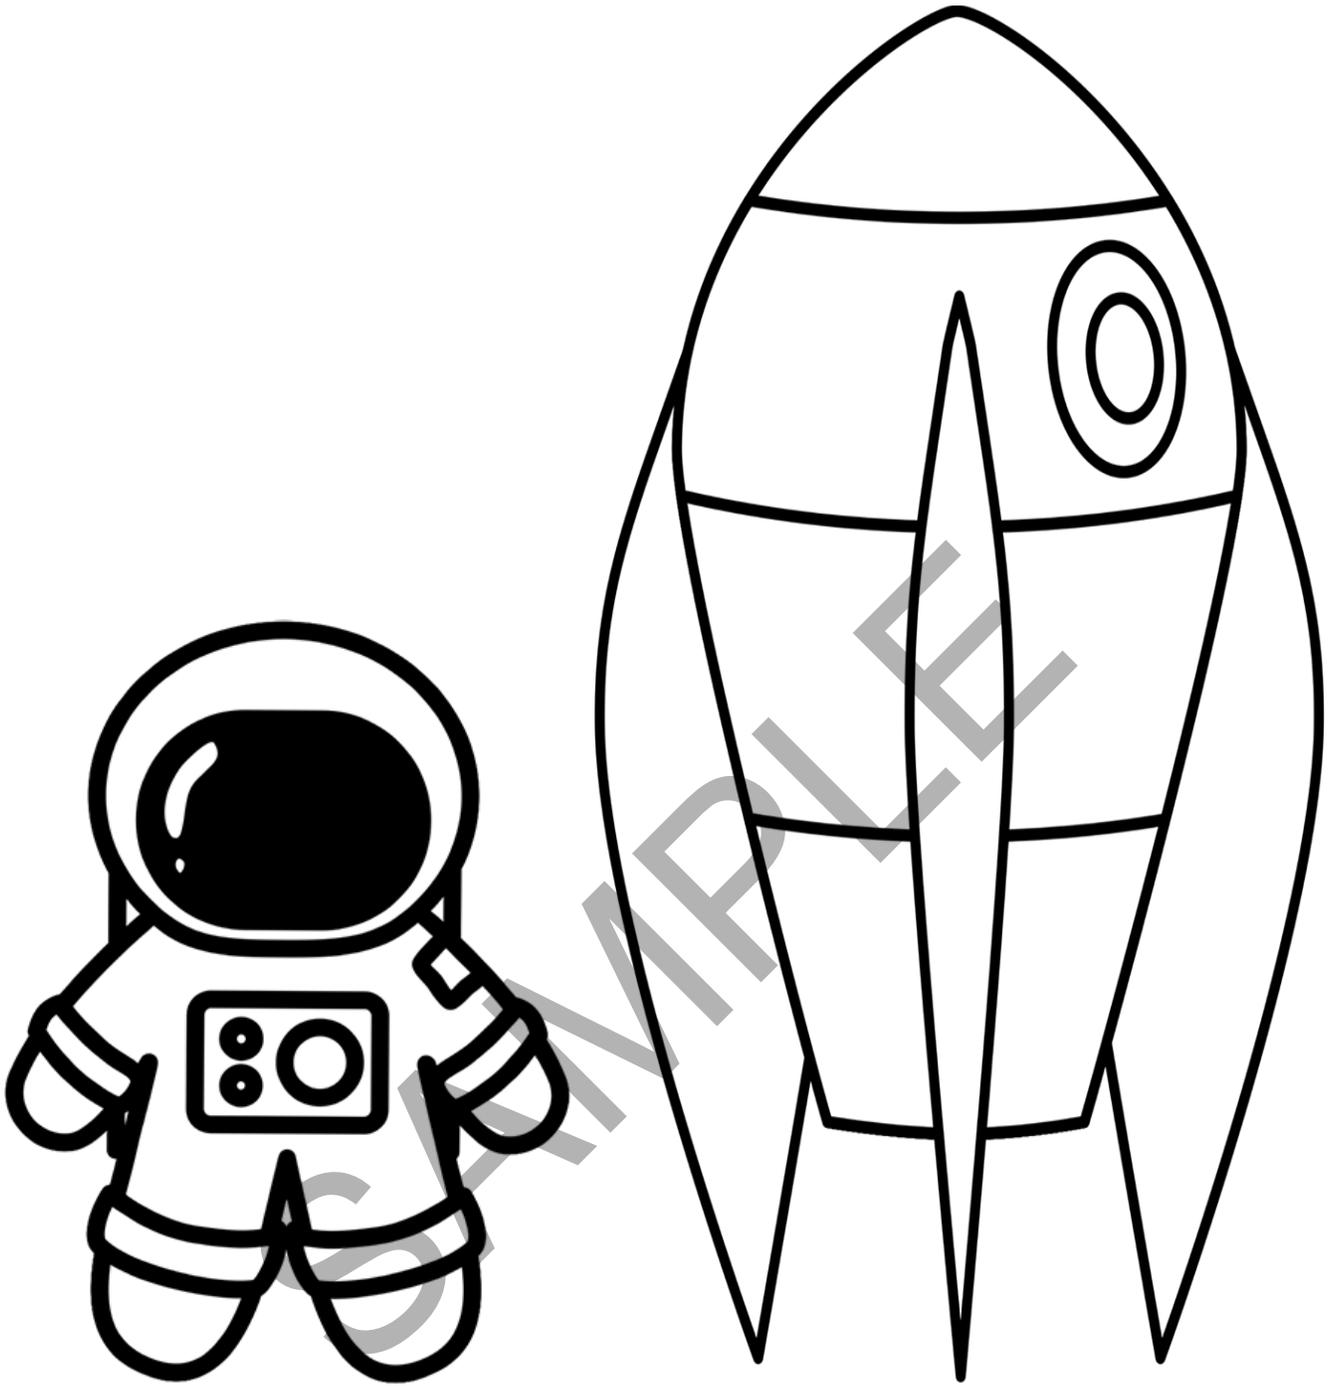

We'll start by  
learning a little  
about something  
called gravity.

Gravity is a force  
that makes things  
fall to the ground  
if they are dropped.

It keeps us on the  
ground and pulls on  
everything, which  
tells us how much  
something weighs.

Are you ready to  
explore the planets  
in our solar system?
