

Have you ever
wondered where
plants get
their food?

They can't make it
in the kitchen or
buy it in the store.

Plants have a
special way to get
their food called
photosynthesis.

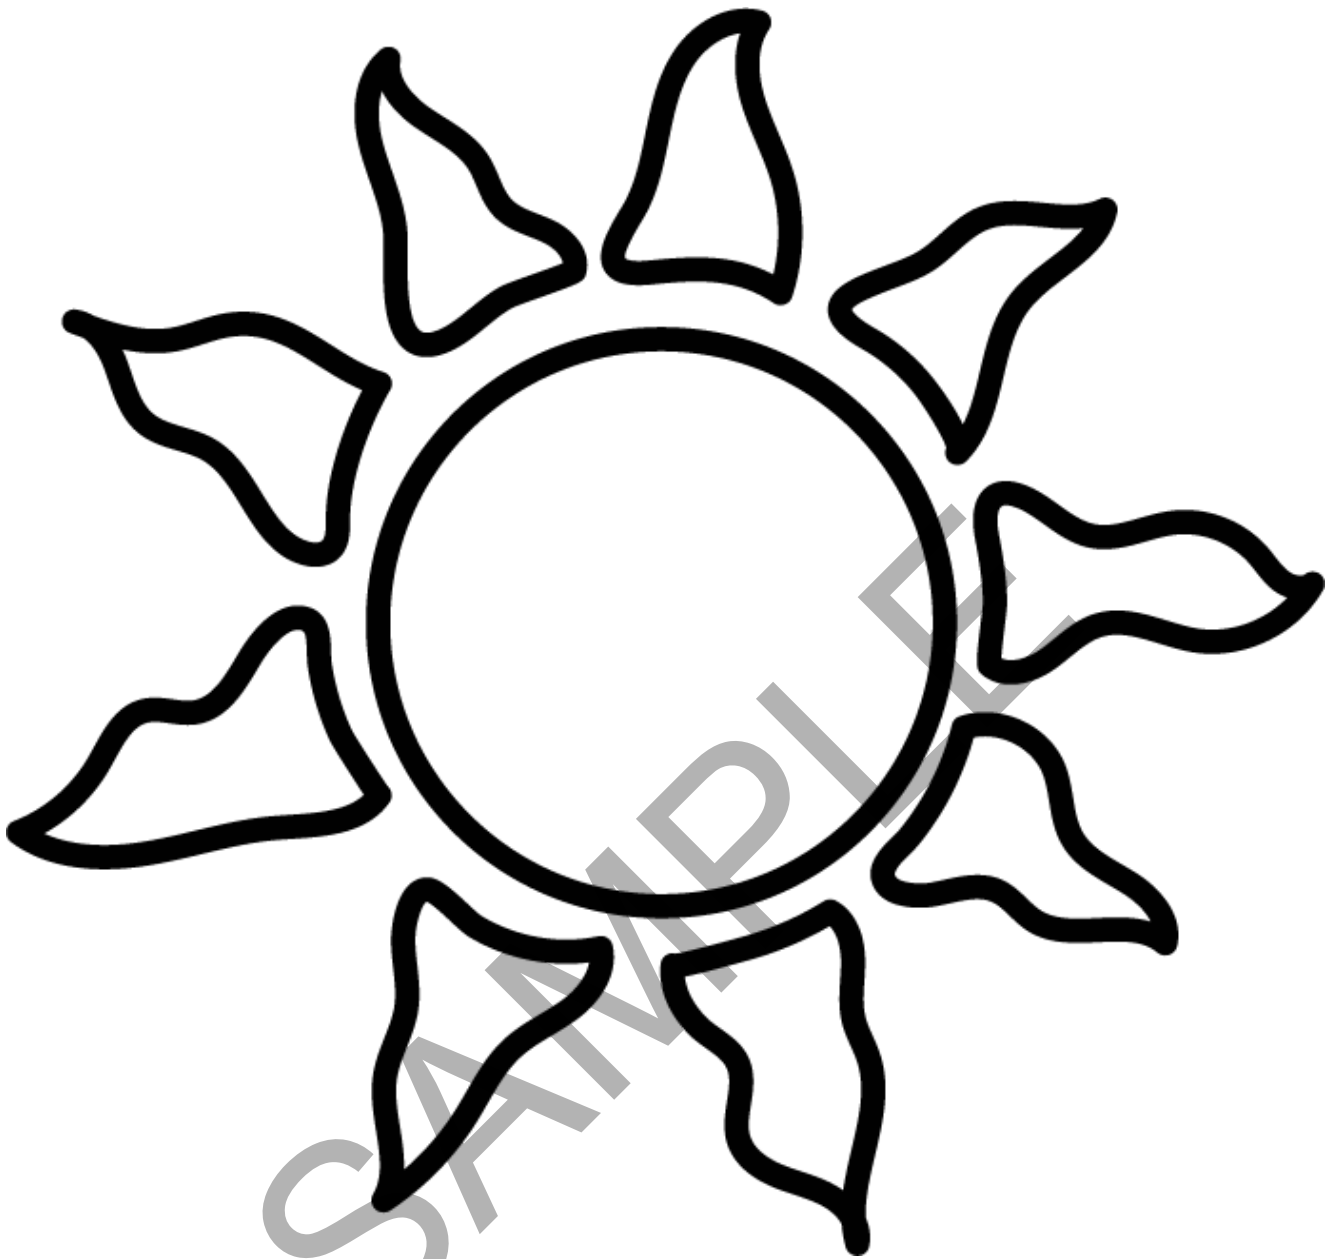

“Photo” means

“light,” and “synthesis”

means “putting

together.”

Plants put energy
from sunlight
together with

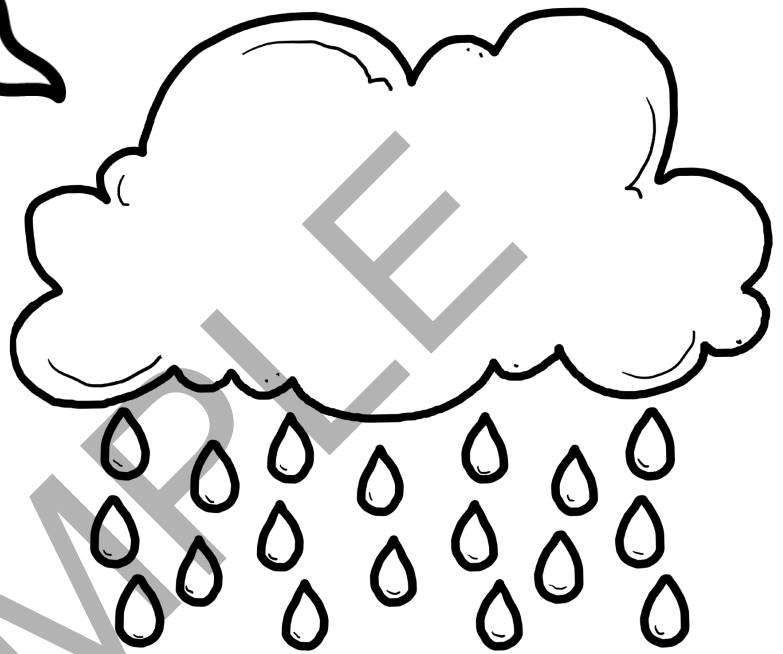

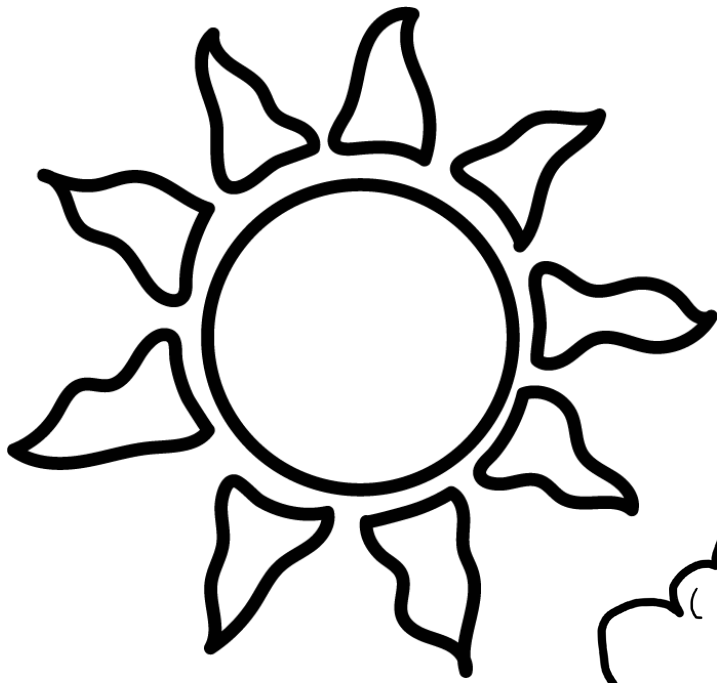

Carbon Dioxide

water and a gas

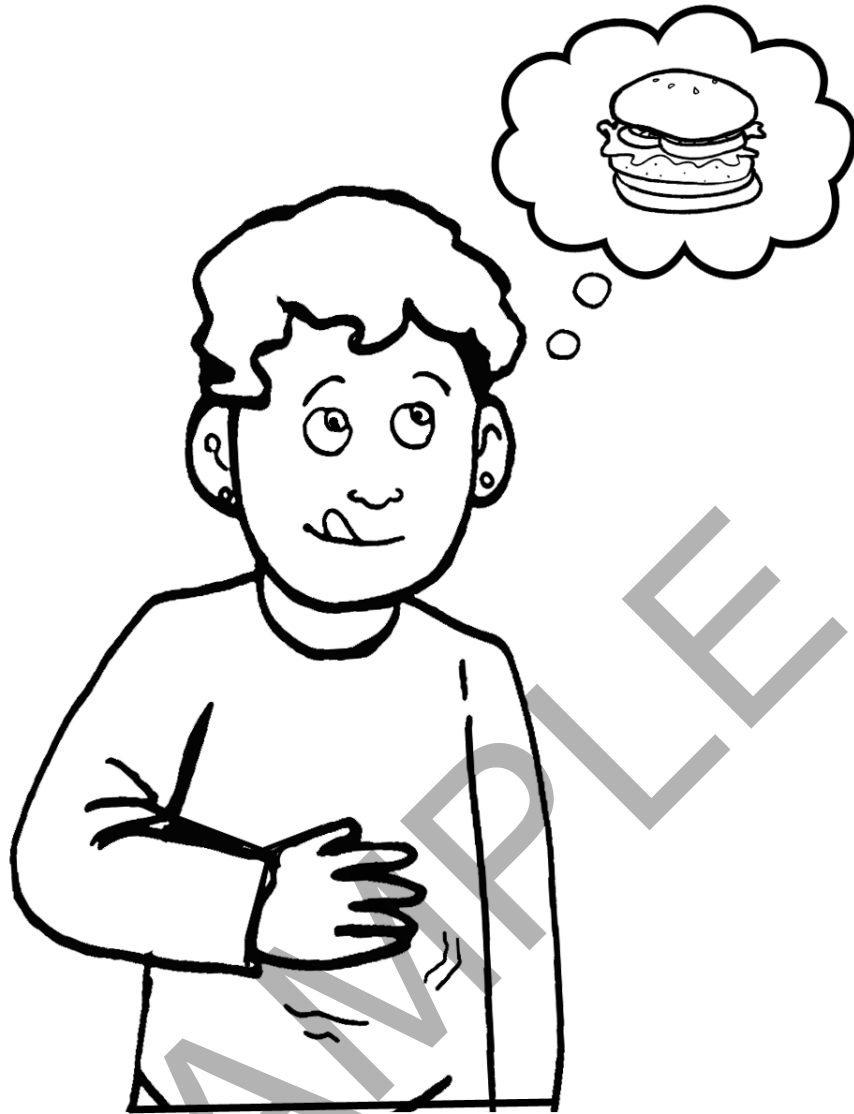

called carbon

dioxide.

Carbon Dioxide

Remember these
three ingredients—
sunlight, water, and
carbon dioxide.

This doesn't sound
tasty to you and
me, but it's the
perfect combination
for plants.
